The prior art of record fails to teach or fairly suggest a multi level pulse translator that generates a multi-level current pulse on each of at least one pulse node, each said multi-level current pulse having a first large current pulse with short duration followed by at least one smaller current pulse of longer duration and operative to switch the CMSO pair with reduced average power dissipation as called for in claim 1, multi-level current pulse generator that provides at least on predetermined multi-level current pulse to said gates of said P channel and N channel devices having a first large current pulse with short duration followed by at least one smaller current pulse of longer duration and sufficient to switch on an off said P channel and N channel devices while minimizing average power dissipation as called for in claims 9 and 19. Therefore, claims 1-27 are presently allowed.
